

## ABSTRACT

A foil sheet of semi-rigid laminated material provides a disposable adhesive pad which includes adhesive on portions of opposing top and bottom surfaces. On a portion of the top side an adhesive is covered by a peel-off label that preferably includes advertising. The remainder of the top surface is substantially a frictionless foil surface. The opposite bottom side is also provided with an adhesive on a portion of its surface. The foil is a medical metal foil that is insoluble in saliva, prophylactic paste, and water. The device is substantially planar, however two wings may be formed along foldlines which provide sidewalls that extend upwardly from the top surface and contain a dental material such as a cleaning paste, holding it on the foil portion of the pad.
